

Claim Amendments:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A mobile communication device comprising:
mobile telephony circuitry configured to communicate with a mobile telephony network using a mobile communication protocol, the mobile telephony circuitry associated with a first telephone number;
a service request module configured to determine proximity to a wireless network base station associated with a landline telephone associated with a second telephone number that is different than the first telephone number, the wireless network base station configured for voice communications via a voice communications network, the wireless network base station further configured for voice communications between the mobile communication device and the landline telephone, the service request module configured to establish a communication path via a wireless data network protocol, and configured to periodically send a session continuation request to the wireless network base station associated with the landline telephone after the communication path is established to maintain the communication path, wherein calls addressed to the mobile communication device via the mobile telephony network are forwarded to the mobile communication device via the wireless network base station while the wireless network base station periodically receives the session continuation request, and wherein the wireless network base station is configured to send a call control message to a registration system associated with the mobile telephony network via a modem;
a power circuitry configured to selectively power the mobile telephony circuitry and the service request module, wherein the mobile telephony circuitry is powered when the mobile communication device is out of range of the wireless network base station, and wherein the service request module is powered when the mobile communication device is within range of the wireless network base station; and

a voice conversion module configured to convert between voice communication and data packets to be communicated using the wireless data network protocol with the wireless network base station.

2. (Previously Presented) The mobile communication device of claim 1, wherein the wireless network base station is configured to send a call control message to a registration system associated with the mobile telephony network after the mobile communication device initiates establishing the communication path to the wireless network base station.

3. (Original) The mobile communication device of claim 2, wherein the call control message establishes redirection of calls addressing the mobile communication device via the mobile telephony network to a public switched telephone network address associated with the wireless network base station.

4. (Cancelled).

5. (Previously Presented) The mobile communication device of claim 1, wherein the wireless data network protocol includes an IEEE 802.11-based protocol.

6. (Previously Presented) The mobile communication device of claim 1, wherein the wireless data network protocol includes a Bluetooth-based protocol.

7. (Original) The mobile communication device of claim 1, wherein the mobile communication protocol is associated with at least one of Global System for Mobile communications (GSM), General Packet Radio Service (GPRS), Universal Mobile Telecommunications System (UMTS), and CDMA2000/CDMAOne.

8. (Previously Presented) The mobile communication device of claim 1, wherein the voice communication between the mobile communication device and the wireless network base station is communicated as Voice-over-IP using the data packets.

9. - 30. (Cancelled).

31. (Currently Amended) The mobile communication device of claim 1 [[29]], wherein the modem includes a digital subscriber line (DSL) modem.

32. - 46. (Cancelled).

47. (Previously Presented) The mobile communication device of claim 3, wherein when a user turns off the mobile communication device after redirection of calls is established, the user is queried whether to continue redirection of calls.

48. (Previously Presented) The mobile communication device of claim 1, wherein a user attempting to place a call using the mobile communication device is prompted to select between placing the call via the mobile telephony network or via the wireless network base station.

49. (Previously Presented) The mobile communication device of claim 1, wherein the service request module is configured to receive a wireless access point signal including an identification associated with the wireless network base station and to determine whether the wireless network base station is a pre-selected wireless network base station based on the identification.

50. (Previously Presented) The mobile communication device of claim 49, wherein when the wireless network base station is determined to be a pre-selected wireless network base station, establishing the communication path via the wireless data network protocol.

51. (Previously Presented) The mobile communication device of claim 49, wherein when the wireless network base station is determined to be a pre-selected wireless network base station, querying a user whether to establish the communication path via the wireless data network protocol.

52. (Cancelled).

53. (Previously Presented) The mobile communication device of claim 1, wherein the voice conversion module converts between voice communications and Voice over Internet Protocol (VoIP) data packets, and wherein the wireless network base station gives the VoIP data packets higher priority than other data packets.

54. (Currently Amended) A mobile communication device comprising:
mobile telephony circuitry configured to communicate with a mobile telephony network using a mobile communication protocol, the mobile telephony circuitry associated with a first telephone number;
a service request module configured to determine proximity to a wireless network base station, the wireless network base station configured for voice communications via a voice communications network, the wireless network base station further configured for voice communications between the mobile communication device and a landline telephone associated with a second telephone number that is different than the first telephone number, the service request module configured to determine whether the wireless network base station is a pre-determined wireless network base station associated with the landline telephone, to establish a communication path with the wireless network base station via a wireless data network protocol when the wireless network base station is a pre-determined wireless network base station associated with the landline telephone, and to periodically send a session continuation request to the wireless network base station associated with the landline telephone after the communication path is established to maintain the communication path, wherein the wireless network base station is configured to send a call control message to a registration system associated with the mobile telephony network via a modem; and
a voice conversion module configured to convert between voice communication and data packets to be communicated using the wireless data network protocol with the wireless network base station.

55. (Previously Presented) The mobile communication device of claim 54, wherein the service request module is adapted to send a call forwarding request message to the wireless network base station to be forwarded to the mobile telephony network when the wireless network base station is a pre-determined wireless network base station.

56. (Currently Amended) The mobile communication device of claim 54, wherein the service request module is adapted to send identification data to the wireless network base station after determining that the wireless network base station is the pre-determined wireless network base station.

57. (Currently Amended) The mobile communication device of claim 54, wherein the service request module is adapted to receive a home portal identification of the wireless network base station to determine whether the wireless network base station is a pre-determined wireless network base station associated with the landline telephone.

58. (Currently Amended) The mobile communication device of claim 54, wherein the service request module is adapted to prompt a user for an indication of whether to forward calls via the wireless network base station after determining that the wireless network base station is a pre-determined wireless network base station associated with the landline telephone.

59. (Currently Amended) A mobile communication device comprising:
mobile telephony circuitry configured to communicate with a mobile telephony network using a mobile communication protocol, the mobile telephony circuitry associated with a first telephone number;
a service request module configured to determine proximity to a wireless network base station associated with a landline telephone associated with a second telephone number that is different than the first telephone number, the wireless network base station configured for voice communications via a voice communications network, the wireless network base station further configured for voice communications between the mobile communication device and the landline telephone, the service request module configured to establish a communication path via a wireless data network protocol, wherein the wireless network base station is configured to send a call control message to a registration system associated with the mobile telephony network via a modem;
a power supply controller adapted to power down the service request module when the mobile communication device is not in proximity to the wireless network base station; and
a voice conversion module configured to convert between voice communication and data packets to be communicated using the wireless data network protocol with the wireless network base station.

60. (Previously Presented) The mobile communication device of claim 59, wherein the power supply controller is manually switchable to selectively control power to the service request module or to the mobile telephony circuitry.
